

Marine 16 Ltd Diesel Bug Test Kit

The Marine 16 Ltd diesel bug test-kit can be used to check for microbial contamination of diesel fuels in boats, storage tanks, home heating fuels etc. Many diesel fuels now carry some biocidal protection that may prevent other test kits from working correctly. A trace of biocide in the fuel will inhibit microbial growth and also growth in the tank. This does not mean that you have no contamination and if your next fuel fill-up reduces the biocide below the inhibiting level microbial growth will proliferate. It may also be that you have problem with diesel by growth despite some form of biocide being present.

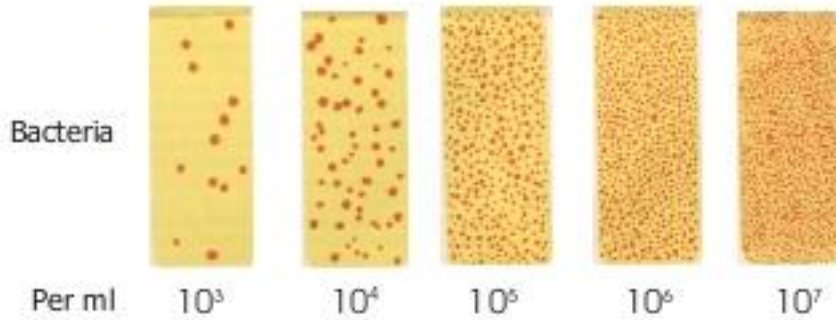

The Marine 16 diesel bug test kit contains a universal neutraliser to remove biocide from the test samples ensuring any micro-organisms present can be traced with the dip-slide.

Treatment of Fuel

Marine diesel bug may be killed completely by using Marine 16 Ltd Diesel Bug Treatment. In nearly all cases there will be no need to clean out the tank as the dead bug masses are reduce to fine particulates that are either picked up in the fuel filter as with any dirt or passed harmlessly through the engine.

For slight infections a 100 ml bottle will treat 2000 litres of fuel, for mild infections the same bottle will treat 500 litres and for heavy infections 100 ml will be required for every 100 litres of fuel.

Total Bacterial Count Agar

Rose Bengal Agar
